

Attendee Name: Bautista, Mariela S.

Speakers Name: Engr. Cuevas

Course | Section: CPE311 | CPE22S3

Date: Mar 26, 2026

- **Webinar Reflection discussing the Key Takeaways**

Attending the CPE Summit Webinar was a real eye-opener because it provided us a comprehensive and extensive overview of the proper use of Artificial Intelligence or (AI) as an academic tool or what I'd basically call an expert study buddy. Instead of talking about just chatbots, Engr. Cuevas looked into the technical side of Generative AI, specifically the fundamental mechanics of architecture that every Computer Engineering student should understand, like the Tokenization and Next Token Prediction. I thought that it was pretty cool and interesting how raw text is transformed through a token embedding layer, which highlights that these models depend on mathematical probabilities rather than just genuine intuition.

One part that really stood out to me was the introduction of RAG or the (Retrieval Augmented Generation) demo. The speaker explained the concept of this and how it works, demonstrating it live with RAG Studio. He showed this using RAG Studio and actually dragged a sample PDF file into it to show how the AI can stay grounded. This was a big moment for me because it showed how we can stop the AI from just making things up or hallucinating by linking it into our own documents. I also liked the the Persona-Task-Context-Format Framework for prompting, because it's something I can definitely use for my own coding projects and lab activities

Besides just the technical stuff, it was also super helpful to hear about learning to hear which AI models are actually the best to use right now. Engr. Cuevas mentioned that the go-to for daily use is the Claude Sonnet 4.6. He also mentioned that Opus 4.6 is still the best option for deep reasoning or research level projects because of its advanced capabilities which can justify its expensive token costs. Also, seeing the Python backend and the Router System Prompt in VS Code made it clear that my future as a Computer Engineering student is not just about writing prompts, it's about building multi-agent systems that can think and navigate data intelligently and effectively.

I also found the Q and A session particularly helpful because it also gave me a very practical perspective about local hosting, the performance differences between the 4.6's models, and how to use AI responsibly and efficiently. This discussion gave me a clear understanding or roadmap for applying these tools in my future career. Understanding which model fits the job I'm working on lets me use these tools the right way. Now, instead of just using AI as an easy way out, I can now use it to actually guide my growth and make sure my work as a CPE student is solid.

• Screenshot of my webinar registration

The screenshot shows a Google Forms interface for a webinar registration. The form title is "Generative AI as an Academic Tool: Understanding the Next-Generation of Learning". Below the title, it says "Your response has been recorded." and provides a link to "Submit another response". At the bottom, it states "This form was created inside of Technological Institute of the Philippines. - [Contact form owner](#)" and "Does this form look suspicious? [Report](#)". The Google Forms logo is at the bottom center.

• Screenshot with my visible name during the webinar

The screenshot shows a Zoom webinar interface. At the top, there is a video feed of a participant named "Christian Jay Cuevas". Below the video feed, there is a list of participants: "CPE311_CPE2253_Bautista, Mari...", "CPE404_CPE3251 Clavin, Mig...", "COE002A_CPE3253_EARL JOH...", and "CPE025B_Cpe32s2-Taala, Gabrie...". The main content area displays a presentation slide titled "System Architect Prompt" and "Documentation Prompt". The slide content includes:

- Your Role**
 - Design system architecture for new features
 - Ensure technical requirements
 - Recommend patterns and best practices
 - Monitor system health
 - Plan for future growth
 - Ensure consistency across solutions
- Architecture Review Process**
 - 1. Current State Analysis
 - Review existing architecture
 - Identify patterns and components
 - Document technical debt
 - Assess scalability bottlenecks
 - 2. Requirements Gathering
 - Functional requirements
 - Non-functional requirements (performance, security, reliability)
 - Integration points
 - Future state vision
- Core Responsibilities**
 - 1. Collaborate with stakeholders to understand requirements
 - 2. Documentation updates - Maintain UML diagrams and gather from stakeholders
 - 3. API Analysis - Use technical expertise to understand structure
 - 4. Dependency Mapping - Track interdependencies across modules
 - 5. Documentation Quality - Ensure docs match reality
- Analysis Commands**
 - Use the `analyzeArchitecture` command to analyze the current state of the system
 - Use the `analyzeArchitecture` command to analyze the current state of the system
- Codemap Workflow**
 - 1. Analyze Repository
 - Identify dependencies
 - Map directory structure
 - Find entry points (entry points, endpoints, services)
 - Other framework specifics

The slide also includes a definition of a paragraph: "A paragraph is a structural unit in writing that consists of a group of related sentences focused on a central idea or topic. It serves as a cohesive piece of writing, such as an..."
